Subject: grossly contaminated soil
Date: 05/11/2011 09:27 AM

Gary,

Yesterday they measured the amount of grossly contaminated soil at the Falcon Refinery. As I mentioned they measured the impacted area at the surface and then used a hand auger to determine the depth.

Based on their calculations there are less than 20 cubic yards of grossly contaminated soil, mainly around Tanks 26 and 7. Additionally there are approximately 500 cubic yards of grossly contaminated soil associated with the Superior Crude tank release, which Superior is taking responsibility.

When the contents of Tanks 7 and 26 are removed the soil around the tanks will be excavated and disposed of properly.
